I don't know why creating a directory wouldn't work? Maybe its path need some modifications in worst case?

Here is an example from other project which you cannot directly copy-paste but I hope it helps:

```
static void CreateDirectory(const char * const name)
{
    auto lock = IDOS->Lock(name, SHARED_LOCK);
    if (lock) {
        logging::Debug("Directory '%s' exists already", name);
        IDOS->UnLock(lock);
        return;
    }

    lock = IDOS->CreateDir(name);
    if (lock) {
        logging::Debug("Directory '%s' created", name);
        IDOS->UnLock(lock);
    } else {
        logging::Warning("Failed to create '%s'", name);
    }
}
```

So the main things here are the check via Lock() and creation part.
