I tested the v. 2.6 from OSDepot but did not find any way to load icons to it...

You would need SketchBlock Pro with the import / export plugin API to load and save icons directly.

You can get SB Pro from amistore or from myself directly (email andy@broad.ology.org.uk)

With the 2.6 you have to do in steps.

Use RAWBinfo to save out the icons images. Load in to SB, resize, export as ILBM and load back into RAWBinfo.
