Does the current 'limitation' in partition width still apply? I have 2 1TB HDDs and 20 or so partitions...

The limit for 'SFS\2' partitons is 1 TB.

Or even more if you don't use 512 bytes/block, for example with 32 KB/block partitions of up to 64 TB should be possible. But I didn't test if that actually works 😊

But even if it works you shouldn't create such large partitions, SFSDDefrag and when 'SFS\2' support is added tools like SFSCheck, PartitionWizard, etc. need several 100 MB RAM to work on a 1 TB partition ...

Creating or restoring a backup of a 1 TB partition very likely takes a few days, even nearly one day if you have identical partitions on 2 HDs and use something like diskcopy for a mirror backup/restore instead of copying the individual files.
