Sorry if I seemed to be criticising you.

OK.

Quote:

I was trying to warn you that there may be errors that you can't detect when two sticks are used. Those errors (if they occur) might cause file corruptions that could spoil your data on disk without your knowing about it.

Suppose I want to download from WWW a 1GB file to disk or copy this file from disk to disk; will it be corrupted without any doubt?

Quote:

I don't know of any memory test process that we can rely on.

Do you suggest that memtester is not reliable for these tests?

Quote:

BTW, what sort of 1GB DIMMs do you have?

The exact ref. is Crucial CT128M72S4R75.36FDY (1GB 168-PIN DIMM 128MX72 SDRAM REG PC133 FBGA Pb-FREE)

Bye,
