Neither of these URLs work in OWB 1.21:

<https://secure.tigerbyte.biz>

<https://secure2.tigerbyte.biz>

Both don't work with the updated curl-ca-bundle.crt, but they don't work for example with AWeb either. In AWeb you can continue without security (just encryption) if you confirm the warning requester that the cert can't be verified, though. IBrowse even continues without any warning.

On the first page there is a custom cert for downloading, but adding it to curl-ca-bundle.crt doesn't help.

I can't give any more info than "it doesn't work" because there is none.

The URLs which don't work are enough in this case.
