Oops! That's what happens when I post things in the middle of the night. I've fixed it now (the download link - the info one was working anyway)

It converts Datatypes images to Spectrum emulator formats (SCR, TAP, TZX etc), similar to ppmtoscr but with more options and a GUI.

@Elwood

As easy as:

```
g++ -o myapp myapp.cpp
```

Plus whatever other compiler switches you fancy using, `-mcrtnewlib` and `-O3` are certainly worth adding for starters.

You don't need to modify the C++ output at all, just treat it like the intermediate asm files some compilers create.

E code needs a few modifications to be compiled with Portable, but these are usually fairly straightforward, and the `OPTAMIGAE` switch takes away the majority of differences.
