It seems very promising !! ATM I'm using CubicIDE the only thing that I miss is a graphical debugger (and a stable gdb port also 😊). I like particularly the fact that contrary to what most of the other existing IDE (any platform) do, CubicIDE is relying on *\*standard Makefiles\** to build, this allows to build projects even when not having access to the IDE (cross compilation for example), that's really an important feature in my eyes and is not an option : ***\*use standard building system\****. And BTW parsing/generating of makefiles is not so difficult
