I am probably being a bit dumb here, but will this enable easier porting of Linux programs?

And, if so, is there any sort of SDK available or required?

Just my,probably unnesessary, thoughts.

AmiCynix is a unix environment for OS4. It makes it indeed easier to port Linux programs. Currently libs for the toolkits GTK2, GTK1, wxWidgets, Motif, FLTK and Xt are available.

And yes, there will be a SDK published for those, who wants to port (compile) their own programs. Most programs will compile without or only with a few changes. But functions like fork()/pipe() are not available and must be replaced by own code.
