Double process entries for each partition?

Hi.

The subject is self-explainable. I'm using SFS and PFS partitions on my AmigaOS 3 setup and i notice that this occurs only with SFS partitions. (Don't know about FFS ones) Both of the processes are consuming a small amount of memory and CPU and i wonder if there is a purpose behind this.

Btw, something else caught my attention. This is from the description of the latest AFA OS update:

"...(SFS), that use the not well known new functions of the optional exec.library V45.20 from OS3.9 BoingBag2."

What is that about?
