I just checked the Gears demo with the updated current beta system and OS4 Final and I also found the new release slower (116 fps instead of 132). However, I tracked down the cause:

With no "640x480" mode in my Radeon tooltypes and no "Picasso96Settings" file in Devs:, Gears was opening an 800x600 screen and running more slowly in that.

When I added a "640x480@70" mode in the Radeon tooltypes, Gears ran at its old speed again.

I don't think this is Saimo's problem on his WB, but it might be for other apps.
