try using the new mode tooltypes instead of the old p96 steerings file

Quote:

I have a RADEON 9000 card, with the following monitor settings:

BOARDTYPE=Radeon

CMPLength=6

(CHIPTYPE=ATIRadeon.chip)

(BORDERBLANK=Yes)

(BIGSPRITE=Yes)

SOFTSPRITE=No

IGNOREMASK=Yes

(DISPLAYCHAIN=Yes)

FAKENATIVEMODES=No

INTERRUPT=Yes

VSYNCMIN=60

VSYNCMAX=85

HSYNCMIN=31500

HSYNCMAX=64000

SETTINGSFILE=ENVARC:Sys/P96.prefs

atm your mixing BOTH systems together:

VSYNCMIN=60

VSYNCMAX=85

HSYNCMIN=31500

HSYNCMAX=64000

are the new system

SETTINGSFILE=ENVARC:Sys/P96.prefs

I know that I'm mixing the two things, but since I'm not defining any mode with the new method, the mix should not have side effect - in fact, if I remove the sync parameters from the tooltypes, nothing changes. I'm not keen on using the new method as it gives less freedom for fine-tuning and, anyway, I don't think it would change a thing given that the Picasso layer would still be there doing its job.
