Hi!

Since there is no forum for JXFS but it is very similar to SFS I thought I'd post here...

I'm about to install JXFS on a large partition of mine to be able to handle large files but then it struck me that I don't know any details and I couldn't find any docs for JXFS in OS4.1.

So, what block size should I use?

Is the correct DOS type JXF\04? (Assuming it is since that is the only thing listed in Media Toolbox.)

Any other details I should know, like recommended buffers for example?
