Well, I'm using JXFS on my largest partition now and after copying everything back I noticed an error in my single most important directory: My programming work directory containing all of my latest work!

As soon as I touch this directory I get this error requester:

JXfileSystem

DH5

has a blockid error in block 27361

Expected was blockid 0x41545452

but the block says it is blockid 0xFC62F92A

The directory looks only halv full but almost all files was copied according to the backup log. Also, I could delete all visible files but the directory is still not empty (only looks so) and I get an error 81 from any DOS tool trying to delete it.

HELP!?! 😞

I have sometimes seen similar errors with SFS but it could fix itself and I would never see the error again. This one is persistant.
