Sorry to hear that Deniil had a problem with his copied volume. It would be the first I've heard of. I can sympathise with your reluctance to change over to a new system. It took me about a year to make the change.

Perhaps you have some hardware issues that only show up occasionally?

The "years" I spoke of refers to the time since JXFS was first released to betatesters (November 2006).

Since I converted my development volume from FFS to JXFS last year, I have had a couple of occasions when the system has crashed while writing to disk (due to program bugs). Whereas in the old FFS days, the system would seem to freeze on reboot while it performed its "validation", JXFS simply puts up a requester during the boot process saying something like "You can use the volume now" (or something, it's only there for a flash and I've never had time to read it).

The speed figures were not publicly released AFAIK. However, the Write speed of JXFS over FFS is obvious to anyone that makes the switch.
