@TSK

I probably should have rebooted when I noticed the error, but I didn't and now I can't get rid of the damaged directory 😞

What do you recommend? Reformat and try again..?

It's quite annoying the file system can't fix an error like this itself by terminating or correcting the damaged block and carry on in a clean state.

I have 37GB on this partition now and really don't want to reformat it again.

@ChrisH

I also didn't quite trust this new file system very much, and SFS/2 even less, but after being out in the public for a while and after the quickfix I thought it would be safe.

Does the author of JXFS have anything to add here..?
