I am another one of those few users of FFS. When I first received and installed OS4.1 on my A1XE, I set up my System partition to use SFS, being newer than FFS, and being bootable. I used, and am still using JXFS for my Work partition.

Fairly soon after my first installation, my SFS partition kept invalidating. It kept trying to write all new information to the exact same block. I reinstalled SFS, reformatted the partition, and reinstalled OS4.1. Again, everything tried to write to the same block, invalidating the System partition. I tried reinstalling a third time. It did the same stuff the third time. I then reformatted the partition as FFS. So, until JXFS becomes bootable, I'll be using FFS.

[Edit: My memory has gotten the better of me. As I remember, the invalidation of my SFS was due to faulty memory. I still use FFS "just in case" it wasn't just the RAM being at fault.]

My big question is, "When will SLB be updated to allow JXFS to boot?" (I know, "When its done!")
