Cairo backend is already included in the OS4 version of Gnash. But for the release version i've used AGG that is more precise than Cairo and since Cairo is not HW accelerated is better.

To use cairo instead of AGG, gnash needs only a simply recompilation.

The youtube problem is not related to any backend because in the gnash testsuite there is a file called "easyvideo.swf" that load from disk a file called "media.flv" (any valid flv video) and that is played with 40% of CPU on my A1.

The youtube problem is into the streaming part of gnash but we (me and gnash developers) haven't find it..
