yes, the video are the worst part of gnash if streamed from network.

60% of cpu is not so bad on a SAM even because it isn't hw accelerated. for example a video that i play with Gnash on my A1 G4 933mhz use 40% of cpu speed while with mplayer that has the overlay on it use only 20% of cpu (and mplayer eat many cpu that gnash..)

So the first thing to speedup is the video reproduction.. maybe Cairo accelerated can help
