If what Fab said is the cause of lag (youtube's slider), would it be possible to optionally use a local control panel for the streaming video? Even if there's no timeslider and only volume, play/pause. As I said just optional for those who need it faster.

I think you are slightly confused as to what gnash / flash do.

They 'play' the swf file. call it youtube.swf for the sake of argument.

youtube.swf is a program which retrieves and plays video from the youtube site. Flash / Gnash / swfdec etc are interpreters for that program. )providing quite a high level API which includes video playing etc)

To leave out bits you'd need to modify the swf file, and I doubt that youtube are giving away the sourcecode to it.

If you want to play flash videos with out all the flash controls etc then use getvideo to download them and then play them afxgroups other "product" (Mplayer)
