Did as you said and this happened.

While "addnetinterface" was halfway through it's procedure:

Network status summary

Local host address = 0.0.0.0 (on interface 'mynet')

Default gateway address = (Not configured)

Domain name system servers = 212.113.161.226

After it finished:

Network status summary

Local host address = 85.138.216.208 (on interface 'mynet')

Default gateway address = 85.138.223.254

Domain name system servers = 212.113.164.26, 212.113.164.24, 212.113.164.25, 212.113.164.23,
212.113.164.26, 212.113.164.24, 212.113.164.25, 212.113.164.23, 212.113.161.226

So, the value I manually entered seems "overrun" by the ones (I assume) automatically assigned by my ISP.
