Ok, so if I have understood correctly, you have to use DHCP since you're directly connected to the DSL line, but you also need to be able to set the DNS manually. Under Windows this is indeed possible to set DHCP to only get the IP address, while the DNS can be manually set separately. I'm not in front of my AmigaOne now, try to see under Roadshow if there's an option to set DHCP for automatic IP address only. With a router this will be much easier, as you'll be able to set both IP and DNS manually and disable DHCP.
