Who in Amiga land knows Java as a programmer? We need advice, comments and suggestions from Java experts as to the best way to sort out bounties for various Java features, classes, JDK, etc. so we can begin defining reasonable bounties and moving forward.

Jamiga's sourceforge page claims it to be an implementation of JRE1.4.1. How important is it to update this to a newer JRE spec? I see that Sun has a "draft spec" for Java SE 7 (JRE 1.7?) available now, and gnu classpath claims it needs at least JDK 1.5 to compile. I guess one could compile on a Linux or other host and run on Jamiga... (via retroweaver?)

Seems AWT implementation needs done. Do you imagine that to be a reasonable project, or does AWT need split up into separate tasks to be reasonable for completion?

Any other comments on the current state of Jamiga as a basis to move forward, or what other classes need priority, and what you'd like to see for Java on Amiga, from the Java coder's point of view?
