BTW:

The XMP plugin crashes here with TuneNet 0.92 (OS4.1 Update 1 Edition) if you start TuneNet a second time (not re-entrable?). I had to switch back to the "old" XMP plugin.

BTW, 2.: Off-topic -> while fiddling with XMP/TuneNet I discovered crashes with the "Sony/Expensive"-Skin which were caused by the BMP.datatype - or to be more precise - the nsbmp subj. I found a newer nsbmp subj in the NetSurf 3 package - this seem to work with no problem. Maybe someone should update the nsBMP.datatype in os4depot to the newer subj ??
