The ATIRadeon.chip driver is the same across A1, Sam and Peg2.

Simon

Oh, I thought kickstart modules were hardware specific ? Not all then.

I do know that since you suggested rolling back to the old OS4.1 pre-update ATIRadeon file that I have not had the corrupted lines since and have not been able to reproduce the problem I was getting with the newer file.

I have now gone back to the update version of the graphics.library.kmod (which was my first suspect) and as long as I use the older ATIRadeon file I do not get the drawing problem anymore.

I still suspect the ATIRadeon.chip even though someone with a SAM seems to be getting correct output with OS4.1 update 1.
