Hmm... I'm not sure, I think I'm only using newlib libraries. Anyway, all the Amicygnix libraries are static, the rest are not.

But since I just managed to compile and link the whole thing with only static objects, and since the critical factor turns out to be the `-mlongcall` flag, mixing shared and static objects shouldn't be the issue.

I'm not sure whether `-mlongcall` versus no `-mlongcall` is going to be an issue, though...?
