So your getting an error which seems to imply dynamic linking (due to .plt reference but maybe it's a red herring) but your not using any dynamic libraries?

Hmm... Yeah, that's strange. I'm not in the same place as my Sam right now, so I will have to check when I get back in a week or so.

EDIT: I forgot to mention, that I changed from linking dynamically to linking static - this was because Edgar provided me with an updated static freetype library, so I no longer needed to use the OS .so version. I don't remember the exact phrasing of the error messages, when I link static only. I'm quite sure, that they mention REL24 relocation truncated, but I'm not sure that they mention .plt at all. I will have to check...

180Mb without debug

WTF is it?

Well, nothing special, really... it's "just" the libQtWebKit module 😊 It seems to consist of appr. 1500 object files...
