Wow...

My DVD-burner is a Plextor PX-820SA...

Xfer mode : best pio 12 (PIO 4, 16 MB/s) / best dma 69 (UDMA 5, 100 MB/s) / current 69 (UDMA 5, 100 MB/s)...

That's your best pio 12 (PIO 4, 16 MB/s)...

Why? Read this:

<http://www.intuitionbase.com/static.php?section=notes>

- UDMA is currently completely disabled for ATAPI devices (CD|DVD readers|burners), this is because it could not be made safe for a1ide, and this limit was not removed yet in the si680 code. In other words, as of now, your ATAPI devices will only get PIO modes. But no worry, it will come soon for si680....S.Guillard

Edit:

Anyone hear any news on that limit, or again missed something?
