Mission critical or not, you can only write good software if you got the tools to do it, and one of those is an OS that helps you point out nasty things.

Even expert software developers make bugs hourly/daily. How do you know if you write good software if nothing is saying that you are? For example, before OS4, you could happily write to address 0 and not be notified and you would think you wrote good software. Now with OS4 you are immediately reminded that you didn't write good software at all.
