Imho, relying of properly written software is far worse that relying on the OS to keeps things in check.

Just to prove how bad it works in reality: there has basically never been any software at all for AOS that has been properly written.

And here's a few reasons why (there's more but I don't have the time):

- There's no vetting procedure to make it happen
- There's no one with resources available to vet their software to the point that it becomes properly written
- The OS does not offer enough support for developers to be able to write properly written software
- There isn't and has never been enough documentation available to write AOS compliant "properly written software"
