URL:

I have installed the uncoming release of Timberwolf available on AMINET (upload section).

Installed it. No error. Install ok.

When I try to run it ... nothing happen.

In fact, 1 task is added... sometimes 20Mb ram is removed ... the ram came back freed avec few seconds ...

and then task is removed

Same after soft reset. and full reset.

I have sam flex 800Mhz 1gb ram

Amiga OS 4.1 u2 installed.

EDIT : I've found the problem.

Installation path contain spaces.

Spaces causes Timberwolf to not work

It was :

DH0:Program Files/Internet/TimberWOLF

I've changed with :

DH0:TimberWOLF

and now it work perfectly.
