I really ought to release my Catweasel drivers, I guess...

The Catweasel Mk4 support for AmigaOS 4.1 (from memory) now stands at:

Amiga DD 880K Read/Write/Format
Amiga HD 1760K Read/Write/Format
MS-DOS DD 320K 5.25" Read/Write
MS-DOS DD 360K 5.25" Read/Write
MS-DOS DD 720K Read/Write
MS-DOS HC 1200K 5.25" Read/Write
MS-DOS HD 1440K Read/Write
C64 1541 170K Read/Write
Apple Macintosh 800K Read/Write
BBC 'B' 100K 3.5" / 5.25" SSSD Read/Write
TI-99/4A 90K 5.25" Read/Write
Atari 800 90K 5.25" Read/Write

I'm working on implementing:

Atari/BBC MFM

Sinclair Spectrum (PlusD)

Amstrad CPC 464 3"

Tatung Einstein 3"

and anything else I can get my hands on.

I've also written a MUI-based disk imager to read/write all these formats. Amiga FFS works and can format, MS-DOS filesystem reads and writes but doesn't format, and fs1541 (the C64 filesystem) is partially working (it reads ok).

Anyone want to help test it?
