Help port GStreamer

@all

Instead of whining, maybe we should try and help joerg and port this gstreamer for him?
Or if no one can maybe we can try to motivate him with money?

I think this is the site: <http://www.gstreamer.net/>

@joerg

I'm quite confident that nearly all of us are very happy that you work hard on owb. And hope you will continue with that.

is it possible in the future, Joerg?

OWB uses GStreamer for HTML5 audio and video, if someone ports it to AmigaOS 4.x I'll use it in the AmigaOS 4.x OWB.

As for the other comments I won't reply to most of them, but I have to correct at least some of the worst nonsense:

- afxgroup didn't port anything in OWB to AmigaOS 4.x, he "just" built the SDL version for AmigaOS 4.x. That's the whole point of OWB: It's a very simple (no GUI at all, no support for multiple windows, etc.) browser for CE devices which can be built for any system without changes.

- I didn't remove AmigaOS 4.x support in the CMakefiles, there never was anything I could have removed.

- I implemented support for downloads myself in the AmigaOS 4.x OWB, before the download code from the AROS author was added to the OWB SVN.

Since most people seem to think the AmigaOS 4.x port of OWB it's useless crap I guess I won't waste my time on it any more.

—— Maybe you'll find someone else who is stupid enough to port the AROS version (required if you want to have support for tabs) or the MorphOS version of OWB to AmigaOS 4.1, but I very much doubt it.
