URL:

so.. i guess i could start by trying to build popt...

edit: ok, here we go... configuring popt with NLS disabled as we don't have gettext.

edit: ok, library configured.. let's try to build it.

edit: first warnings;

popt.c: In function 'execCommand':

popt.c:525: warning: implicit declaration of function 'execvp'

popt.c: In function 'poptSaveLongLong':

popt.c:743: warning: implicit declaration of function 'srandom'

popt.c:744: warning: implicit declaration of function 'random'

let's change those to srand and rand to get rid of those.

edit: almost done, one error left..

undefined reference to `execvp'

hmmmm...

argh.. newlib is missing execvp..

let's try to build for clib2 and disable iconv then..

edit: actually, no. let's not build it for clib2 as it's outdated and we need it for newlib.

the problem line looks like this:

```
rc = execvp(argv[0], (char *const *)argv);
```

i don't know what it does, or how to fix it, but i commented it out and the test cases seems to work, but i don't feel good about it..

can anyone help out here?
