Problems executing Loonix scripts

URL:

I have a problem executing Loonix scripts under some conditions.

I am trying to configure GMP in its own drawer. I can configure Kaffe in its drawer, so the problem is not universal.

What happens is that when the script tries to run another instance of 'sh' to run a sub-script, the sub-script can not be found. If I try to run that sub-script from the command line, it also says it can not be found.

eg:

```
/Java/GMP/gmp-4.2.1> ./configure --build=ppc-amigaos
configure: creating cache /dev/null
configure: error: cannot run /bin/sh ./config.sub
```

```
/Java/GMP/gmp-4.2.1> ./config.sub
"config.sub" not found
```

The permission bits for the files are:

```
/Java/GMP/gmp-4.2.1> ls -l config*.*
-rwxrwxr-x 1 root wheel 23065 2006-05-05 02:36 config.guess
-rw-rw-r-- 1 root wheel 15353 2006-05-05 02:50 config.in
-rw----- 1 root wheel 4437 2007-01-14 20:44 config.log
-rwxrwxr-x 1 root wheel 4127 2006-05-05 02:37 config.sub
-rw----- 1 root wheel 1966 2007-01-07 15:41 config.sub.info
-rwxrwxr-x 1 root wheel 43636 2006-03-15 01:57 configsf.guess
-rwxrwxr-x 1 root wheel 31164 2006-03-15 01:57 configsf.sub
-rw-rw-r-- 1 root wheel 111778 2006-04-30 09:31 configure.in
-rwxrwxr-x 1 root wheel 1073487 2007-01-14 19:20 configure.old
```

Since this process runs quite well in another directory using other scripts, I suspect it is something to do with the permission bits or sh's treatment of them.

Stack is 5 MB.

Any ideas?
