Tried the version of coreutils from 2006-10-29, but no better.

The newer "config.sub" doesn't get very far. It claims that gcc doesn't work and fails. Still trying to find out why.

[edit] Silly me, it IS working now with the newer config.sub and config.guess. It's now failing later in the configure script, so I think that solves the current problem.

Thanks for your help.

[I hate Loonix]
