but the Fab version is a great and complete browser,

His version doesn't even have an usable GUI but uses some MUI crap instead 😊

Quote:

the problem is not OWB itself.

I guess you already forgot what OWB actually is. Andrea's old SDL build of OWB is still on [os4depot](http://os4depot) and you should check it again. There is nothing missing in it. Anything more than that (except for using newer OWB revisions, which was stopped 2-3 months ago), for example a GUI or support for multiple windows/tabs, doesn't exist in OWB itself but was only implemented in the AmigaOS 4.x port.
