Well you can call it as you like, but MUI is a toolkit to create GUIs as Reaction or what you use for your OWB port, maybe you don't like it and I can understand your point of view, but things doesn't changes too much.

For example I don't like Microsoft Windows, but I never say that Windows isn't an OS etc ...

But turning on OWB now i'm curious to know what you intend for a GUI, because maybe our ideas are very different.

- For me a decent UI of a browser must have almost a window that shown download progress + resume (maybe an integrated download manager not dozen of separated windows)

- Multiple window support
- A visual preferences window (not crappy tooltypes '80 style)
- Graphical Cookie manager
- A decent bookmark handling (not a separated window)
- A password manager

and so so on ...

I guess you already forgot what OWB actually is. Andrea's old SDL build of OWB is still on os4depot and you should check it again

Yes I remember the first Andrea's release althought at that time I didn't have OS4 at home, but you talking about a 3 years old release, personally after 3 years I would expect mutch more than tabs support ...

Aniway you decide ...
