Learn plain C first. This can be done on any platform. When you get the hang of it, then start learning Amiga specific stuff. I'd recommend the same regardless of which OS you're working on.

Also, I recommend sticking to GCC. I see no benefit to using VBCC unless you're used to it. Plus, VBCC doesn't have C++ support, and that's going to matter further down the track when you want to do Object Orientated Programming (OOP). OOP makes working on larger projects much easier.
