We mean this; your email ends with .fi, while your domain of the ISP you're using to send in the blocks, ends with .org or .com, like telia.com.

I substitute the email, yet the domain is wrong. Look at the US Commercial entry, then compare it to email. You should notice a difference if you add the numbers up.

Each block sent in, is tagged with the sending IP, the email, the block, the OS, the CPU and alot more. That's why the stats isn't completely accurate. It's old and I think, no longer maintained, but still quite usable.
