URL:

I just want to show a video , which show how cool can be setuped EUAE over [GLUAE scripts from saimo](#). You just double click on icon of game, and game starts (with settings whic you setup in config file which you also put to the game directory).

Of course, for some of you it will be harder if compare with Crhis's RunInUAE, but in case with GLUAE you can control everything for every game/demo with no problems, just by changing the file.

So, [there is a video](#)

I show there the most heavy-aga based (and not only aga) games, which works with no problems and pretty playable even on 1ghz cpu on my peg2.

Games which i show here:

Aladdin (aga)

KidChaos (aga)

Ruff & Tumble (esc)

SlamTilt Pinball (aga)

SuperFrog (esc or aga, do not remember already:))

SuperStardust (aga)

Gods (esc)

All games runs just by db-click on their icon, and closes by close gadget.
