JXfileSystem requester ...

Author: : redfox

Date: : 2011/7/23 22:57:46

URL:

This afternoon, I powered up my MicroA1 system and received the following Requester ...

JXfileSystem DH1: (a1ide.device, unit 0)

resetcachefugger: CacheBuffer is still locked!

Please notify the author!

I clicked continue

Grim Reaper for AmiDock croaked with 80000003 DSI error

I clicked ignore DSI error

Another requester showing ...

JXfileSystem DH1: (a1ide.device, unit 0)

Function 'unlockcachebuffer' detected an invalid Cachebuffer!

This is a safety check requester, which should never appear under normal conditions. Please notify the author about the error above and if possible under what circumstances it appeared.

BEWARE: The filesystem might crash if you click continue.

Please save your work first!

powered off and on to reset

Appeared to come up ok when I powered on my system again.

This is the first time I have seen these requesters about JXfilesystem.

Should I be worried? Is this an indication of more trouble to follow?

Who is the author for JXfilesystem ?

redfox
