The Amiga-way-of-programming(sadly) wasnt here from a while since now...

That's not true, and is also no excuse for trashy coding.

Quote:

And having a littel tool that works fine with the only limitation that outputting raw instead of your preferred codec I think was really much than "better than nothing" imho...

There already is [something](#) like that on os4depot.

And also better to have something like it "now" and than work on things like output decoders than first work on all the needed dependencies and than build the program imho...

Except that it won't work well enough to be usable. I tried out a video editing program on Linux once that was like that, except that it could also only load one particular video format, which wasn't the format that my camera produces. As a result, it was totally useless, and it was quickly deleted from my hard-drive.

There is no point to have something "now' that "sort-of-works." Nobody will want to use it.

If you're going to start a bounty, then start a bounty for something done right. I'm not going to donate a single cent to a bounty that allows dirty hack jobs.

Hans
