@Hans

I've also thought about this.

ktadd have done a good job on the backend of things; getting ffmpeg and mencoder to play nicely with effects, clips and text entered in a GUI.

Currently he uses mplayer to play a preview with the same parameters as ffmpeg/mencoder would get when doing the work.

Using libavcodec for displaying a thumbnail preview instead is not very far away. No need to create a mid-step with raw data or anything. Just create all clips (i.e. the time stamps), display it for the user with libavcodec and then supply the backend (ffmpeg/mencoder) with this data and voila: A video! 😊
