@Hans

well..

I stated that the program have to work fully without for the saving part...

loading and editing have to work fully...

Only saving can be done in other ways..

I explained bad?

No, you didn't explain it badly; I understand perfectly well what you mean, and I disagree strongly. I'm advocating doing things properly in a manner that we get a good foundation on which to build bigger and better stuff. You, on the other hand, want to go for the cheap and quick hackjob that will result in something that sort of works. If dirty hacks are good enough for you, then go ahead. I'm not interested.

If someone took the time to create an avencoder.library to complement the avcodec.library, then anyone who needed to could write a program that generates video files easily in a properly integrated and efficient manner. The encoders would be the same ones that are compiled into the ffmpeg library (as I said, libavcodec and ffmpeg are part of the same project, and avcodec.library is libavcodec as an Amiga library), so it's not that big a task to do this.
