I am having major problems with DVPlayer on my SAM460 since upgrading to update 3!

If I launch DVPlayer (full version or demo version) instantly I get screen corruption, loads of random lines and colours. Do not try and load a movie or anything, this happens as soon as I double click the icon to launch the program.

I know you said it works fine for you, what machine is that on?

If I drag other program windows over corrupted screen areas it clears to normal workbench look but also I get a grim reaper at same time as I launch the program.

Any ideas?
