AmigaOS4.1 Update on SAM440EP - system freezes on workbench launch

Hello fellow Amigans!

I have installed Update 3 from Hyperion and I ran into trouble.

On system boot I can see the new Splash Screen but after it when Workbenches launches the system completely freezes. All I get is a grey WB background. I can see my partitions Workbench, Work , Work2 and Ram Disk.

In the middle of the scree I can see AmiDock trying to load its contents but stops with just 2 Icons. That's all - same behaviour everytime I try to boot.

I have tried to boot without keyboard and mouse - same result.

With Update 2 I had no problems.

Please - can someone give me a hand where to start looking for the problem?

I have a SAM 440EP with aRadeon 9250 gfx card.

P.S. I have completely installed a fresh System beginning with formating dh0: and installing from Update 1 CD. An then withot chnging something straight update 2 anf then update 3.

Thank you very much for your time!

Andi
