Some possibilities:

- * Corrupt installation of OS4. But I think you said you tried format & reinstall without luck? Then that isn't the problem.
- * One of your hardware devices is causing a problem. Not sure what you have plugged in, but you already tried unplugging mouse & keyboard. Any PCI cards or other USB devices plugged in?
- * How are you unpacking your Update 3 archive? If not using UnArc then use that.

Very strange, and you already seem to have ruled out most possibilities, so have to start looking at unlikely possibilities. Try unarchiving Update 3 again, maybe it got corrupt? Does your Sam440 have built-in gfx card? (Try using that instead of Radeon 9250.)
