I tried running TW from RAM: (renamed as "RAMdisk" i.e. no space) and it runs very well. It loads in 5 seconds on a Sam460

Since the default label for Ram: has been the same for many years and some programs may use the name "Ram Disk" or have saved it in some config or prefs file, it is best to relabel Ram: like this in your user-startup:

C:Relabel RAM: Ram_Disk

C:Assign "RAM Disk:" RAM:
