@ MickJT

Yes, sorry. I'll get back to you asap, but the recent days/weeks have been hell.

@ samo79/swoop

I have fixed most of the download problems now, including saving to RAM Disk: and the problem with "cannot save :filename" thing. As far as I can see the Download manager is the only problem that remains. You'll be able to see for yourself once RC1 comes out.

The download manager complains about a malformed file specification when it's not open, but works when it is open. I'm currently looking into that.

@ redfox

I'll look into this. For me, it works unless I release the mouse button outside TW's window. I need to look into the window assignment anyway since there's also a problem with popups opening combo boxes and similar

@ Rob

Using a video layer might work, but I'm not sure if the internal player supports that. I'll have to check it. I didn't have time to look into that yet

RAM is a problem, but I have hear from people using it with the pager enabled on 256 MB machines.

@ vox

I didn't say "next version". For now, I will try as much as I can, but there are limits
