Using the new RC2 version (fresh install) I get a crash on startup every time when running it on my µA1-C. The crash is in libcairo.so.

Same crash I get

About four times out of five, I get an ISI on my SAM460ex; I haven't looked to see where the crash is. I just leave the GR completely alone and relaunch Timberwolf. It almost always comes up OK this time. If I get a DSI or a "program error" (I haven't had an ISI twice), I ignore the second GR also, and the third time is always the charm: <http://www.bartssite.net/GRs.jpg>

I came to this thread looking for an answer to a different matter. When I try to download a file, say one called "File," I always get this error: ":File could not be saved, because an unknown error occurred. Try saving to a different location." Note the colon preceding the file name in the error message.

Is this standard for RC2, or is something special going on in my system?
